At page 21, line 5, change the paragraph to read as follows:

Examining the component interface in more detail ActiveLINC client applications access the remote LINC application through a set of objects. As illustrated in Fig. 5, the primary object is the LINC Environment's object 60 which represents a connection to a remote LINC application. This object is used to create Ispec objects e.g. 61 from the generated Ispec components 62 and to handle the exchange of transaction requests and responses with the remote LINC application. Client applications can have multiple LINC Environment objects, giving them concurrent access to multiple LINC applications, possibly running on different host systems.
